chapter XXIII
Annotation field research, 56/As,
Description Thought**

*

(*) Cognitive Research Department

(It should be mentioned, the relevant importance of brain biochemistry in the development of thinking, as we mentioned earlier in another paper).

We must distinguish two types or premises of thought, leading to confusion . (It is relevant to mention that the mental process is the grouping of both premises).The mental process is not thought as the basic unit (without ipseity). The mental process is the grouping of two distinct subjective structures.

First premise is a dialectical or discursive thought, that use of the language learned from childhood is the fundamant for development of intellective reasoning.

The second premise is no discursive thinking or dialectical language. That is, a thought process based on non conceptualization (subjective thought structure without conceptualizations, basic unit).

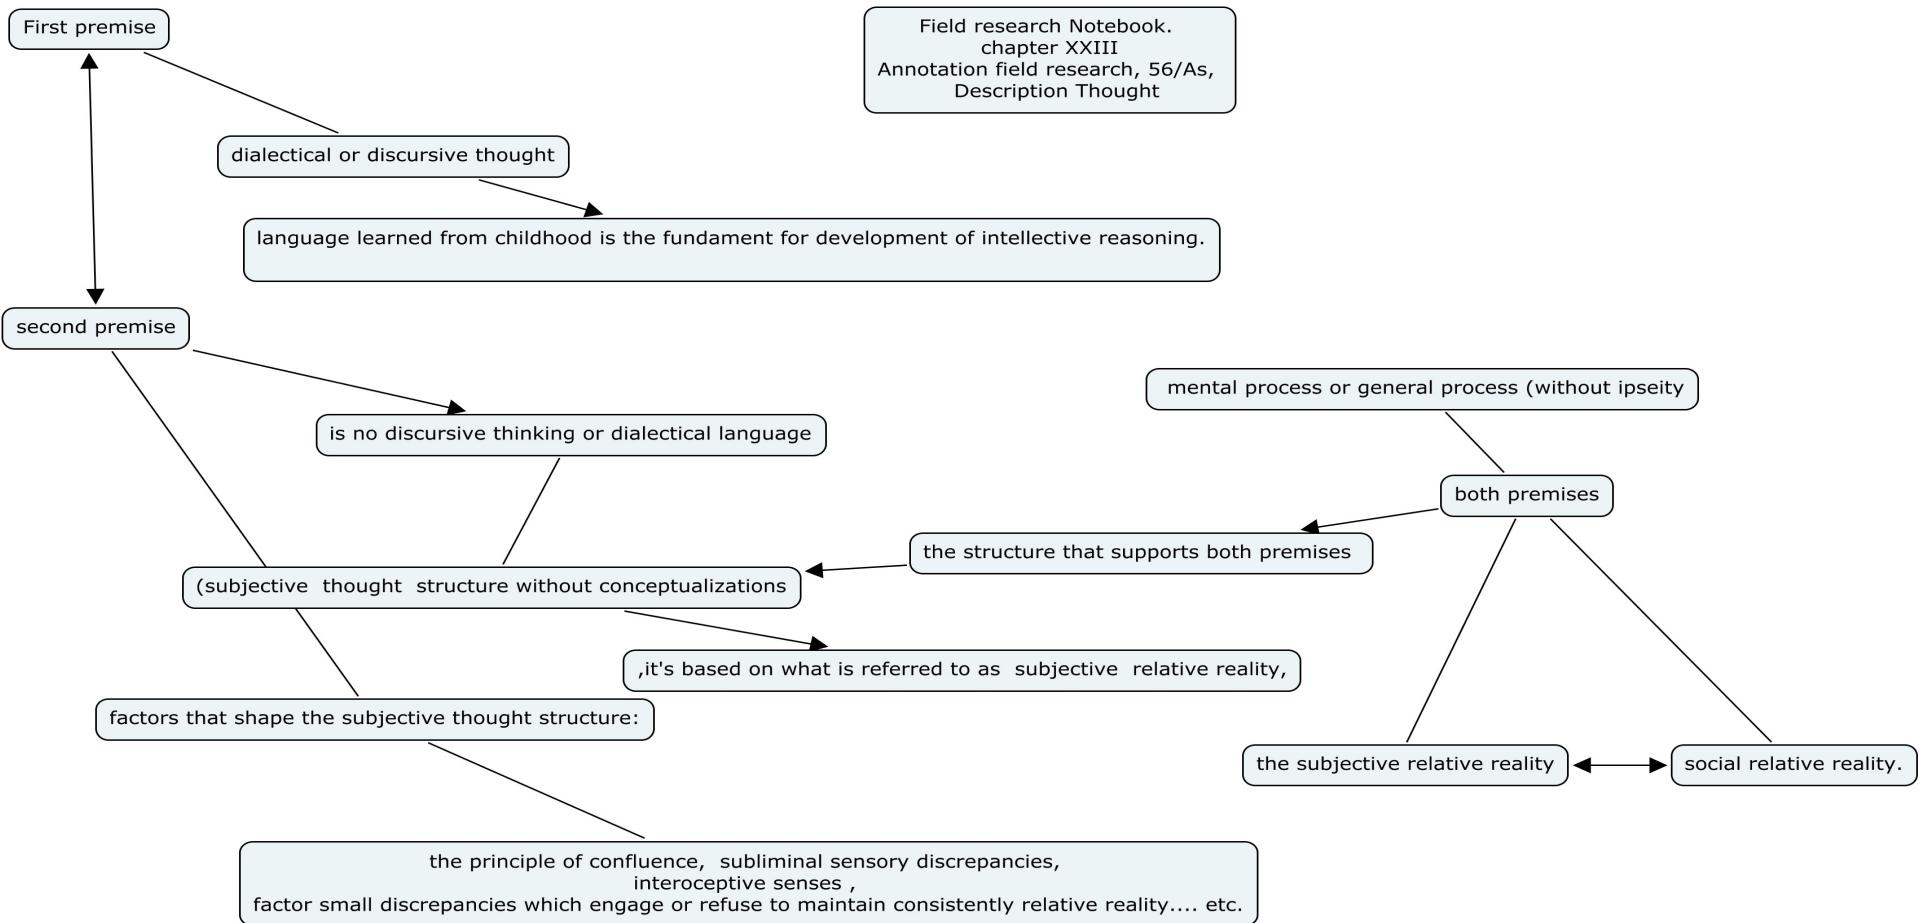

Now the following happens , the two underlying premise together , leading to a confusion of the nature of what is thought.

The mental process or general process (without ipseity) of joint thinking both premises , however, the structure that supports both premises of what the thought process is the second premise , structure is subjective thought structure without conceptualizations.

El mode functionality of the second premise is the subjective towards the objective ,it's based on what is referred to as subjective relative reality, this is linked to objective reality on the perceptual environment.

There are multiple factors that apperceptive become perceptual , in the many factors that shape the subjective thought structure: the principle of confluence, subliminal sensory discrepancies, interoceptive senses , factor small discrepancies which engage or refuse to maintain consistently relative reality.... etc..

However, if we can determine a hurried way, that means backing eeg, etc., modes, as shaped and expressed the subjective relative reality and together with the first premise, conceptual in social relative reality.
